Add and Subtract Fractions

Show how to separate parts referring to the same whole. Think of fractions like parts of a whole shape. There is an example below to help you.

Solve

$$1. \frac{3}{4} - \frac{1}{2} = \quad \square - \quad \square = \quad \square$$

$$2. \frac{5}{5} - \frac{1}{3} = \quad \square - \quad \square = \quad \square$$

$$3. \frac{2}{6} + \frac{2}{3} = \quad \square - \quad \square = \quad \square$$

$$4. \frac{2}{8} + \frac{1}{2} = \quad \square - \quad \square = \quad \square$$
